INDIA
BACKGROUND

India accounts for about a quarter of the global TB burden with an estimated incidence of 2,590,000 TB cases and 124,000 MDR/RR-TB cases as of 2020. TB kills approximately 480,000 Indians every year, i.e., more than 1,400 every day. India also has more than a million ‘missing’ cases every year that are either not notified or remain undiagnosed or unaccountably and inadequately diagnosed and treated in the private sector. [1,2]

India was on the up-hill trajectory of notifying TB with a peak of 2.4 million case in 2019. Due to the COVID lock down in India, like in many other countries, notification tumbled by 25% in 2020. However, since India has a very strong TB notification system NIKSHAY, India was able to recognize the decline in TB notification early during the pandemic and mount efforts to mitigate this on priority through TB and COVID bi-directional screening and testing, augmenting laboratory services, and treatment capacity upgrades. [3]

The national Strategic Plan 20017-2005 (NSP 2017-2025) proposes bold strategies with commensurate resources to rapidly decline TB incidence and mortality in India to SDG target levels by 2025, five years ahead of the global timelines. A major activity for the programme was to set up a state of art TB surveillance system and integrate it into the existing Nikshay platform. [4]

As per the NSP 2017-2025, effective ICT support will be the cornerstone for facilitating engagement, user-friendly patient reporting, people centric treatment adherence monitoring, and for smooth financial transactions. The e-Nikshay platform, supported with efficient call centers and provision of sufficient digital tools to field staff and providers, is key to reaching patients in private sector. Adherence system using ICT platform is also being strengthened with the use of additional tools such as 99 DOTS, Pill box etc. [4]

NIKSHAY platform is one of the most evolved and advanced TB surveillance platform that was developed by National TB Elimination Programme (NTEP) and National Informatics Center (NIC). It has been rolled out across the entire country for TB notification and monitoring of patients through the entire continuum of care at all levels. NIKSHAY platform is much more than just a TB surveillance system. It has various innovations and integrations which sets an example for other countries to learn from.

Starting with presumptive TB enrolment and referral for testing, progressing through laboratory diagnosis and notification, drug prescription, supporting adherence to treatment till successful outcomes and providing opportunities for post-treatment follow up for long-term, it also has integration with Laboratory Information Management System (LIMS), Prevent-TB India contact-tracing and TPT app, Nikshay Aushadhi (the drug supply chain web and mobile application), PFMS, (the Public Finance Management System that supports direct benefit transfer (DBT), financial transaction of patient enablers and provider incentives). Various innovative modules and integrated solutions that uses the NISHAY backbone such as Arogya Sathi app (aimed at proactively increasing awareness among the citizens and ensuring availability of free and quality assured drugs), and Nikshay Sampark (the patient support call centre for grievance redressal) and adherence monitoring tools such as 99 DOTS.

Technology penetration plays a crucial role in providing enabling ecosystem to foster digital innovations. As of January 2021, the country has nearly 79% of the population having a mobile phone, and 54% using smartphone. India also has 45% internet penetration which has grown by 8.2% against previous year. This provides a very conducive environment a strong foundation to implement advanced solutions and ensure adequate uptake. [4]

Based on the multi-stakeholder discussions, interviews and independent research, and guidance from the National TB Program, this assessment report is an attempt to describe the current capacity and identified gaps/challenges in the digital ecosystem of TB surveillance. The report shares strategic recommendations for developing a comprehensive case-based surveillance system in the country while leveraging the existing infrastructure, in-house capacity, and assets.
# BRIEF OF DIGITAL CASE BASED TB SURVEILLANCE SYSTEM

India uses NIKSHAY platform as the national case-based TB notification and surveillance that is scaled to all TB units and facilities across the country. In 2012, India began its transition towards a digital TB ecosystem with the introduction of the NIKSHAY platform. Over the years, this platform has evolved incrementally and has become a real-time case-based TB information management tool which is used by both public and private providers in the country.

The central TB Division (CTD) of Ministry of Health and Family Welfare and the NIC have jointly developed Nikshay. To support development and maintenance and to provide technical guidance, there is a core team in CTD supported by WHO India and Bill and Melinda Gates Foundation. Since Nikshay is in continuous evolution, users are regularly alerted on new features through the link [https://nikshay.zendesk.com/hc/en-us/articles/360016723931-What-s-New](https://nikshay.zendesk.com/hc/en-us/articles/360016723931-What-s-New) with corresponding online training materials through [https://nikshay.zendesk.com/hc/en-us](https://nikshay.zendesk.com/hc/en-us) publicly available in Nikshay website [www.nikshay.in](http://www.nikshay.in).

NIKSHAY system is fully accessible to the private sector also. After a self-initiated or facilitated registration in the system, private facilities are provided with access to full cascade of care of patients notified by them.

NTEP publishes real-time TB notification report in the website national, state, district, TB Unit level, both for notification from public and private. [https://reports.nikshay.in/Reports/TBNotification](https://reports.nikshay.in/Reports/TBNotification). NTEP also publishes quarterly reports "Nikshaypatrika" and annual TB report on the website [https://tbcindia.gov.in/](https://tbcindia.gov.in/).

Apart from publicly available data and reports, Nikshay system has autogenerate analytics, reports and feedbacks provided to programme managers at all levels.

# SUCCESS STORIES

India has been one of the pioneers countries to conceptualize a digital solution to cover the entire TB care cascade for real-time case-based surveillance.

With the launch of Nikshay version 2.0 in 2017, the NTEP has fast expanded the engagement with private sector resulting in a remarkable increase in TB notification. Along with this, active case finding (ACF) strategies supported by Nikshay, 0.7 million cases have been additionally notified by 2019, with a 40% jump compared with 2017, significantly narrowing the gap in treatment coverage. With dashboards available at all levels from peripheral users to the national policymakers, Nikshay has been pivotal in empowering local administrative TB responses by take locally appropriate decisions. During Covid-19 lockdowns, Nikshay has been the warfare tool in daily monitoring of TB notification and treatment adherence at all levels of the programme management units, enabling the country to rapidly catch-up TB care and minimize impact.

The NTEP has also used Nikshay data along with TB drug-sale surveillance, variance in number needed to test in measuring under reporting and decline in incidence to render subnational disease-free certification for eligible districts and states. The most remarkable aspect of this tool is its massive scale of implementation, that receives data from all over the country, prominently on a real-time basis making it the largest real-time TB surveillance system in the world.
### KEY DATA VARIABLES

**STATUS OF ELECTRONIC CASE BASED TB SURVEILLANCE**

- Electronic system for case based TB Notification: NIKSHAY
- Lowest Unit for TB notification digitisation: Facility level
- Stage of notification: Diagnosis
- Level of Access and Use of TB Notification data: Facility level
- Private sector notification: Patient Provider Support Agencies (PPSAs) and Private facilities with access, report individual cases in NIKSHAY
- Frequency of digitization of TB notification: Real time
- Mode of follow-up with notified cases: SMS follow ups, Dedicated call centre, Home visits
- Scale of implementation: National roll out
- Contact tracing for TB notified cases: Currently done through Prevent TB app (Pilot in Kerala and Chhattisgarh); will transition to NIKSHAY
- Multi-channel enablement: NIKSHAY has a desktop as well as mobile app for data reporting, a patient centric app has also been introduced
- Govt. order for mandatory TB notification: Yes

**PRIVATE SECTOR NOTIFICATION**

Private sector clinics and general practitioners have a complete access to NIKSHAY and are mandated to notify all TB cases being identified and/or put on treatment. Patient Provider Support Agencies (PPSAs) are also supporting in getting the private cases notified in NIKSHAY. 30% of the total TB notified is by private sector and the treatment outcome is reported in NIKSHAY by the private sector either directly or through PPSA.

**COUNTRY IT CAPACITY**

- **Country Server**
  - Servers are hosted by the National TB Program, and managed by the in-house IT team
- **Interoperability**
  - NIKSHAY platform allows an integration with other tools through APIs and Data Export mechanisms. Already integrated with LIMS
- **Country IT team**
  - National TB program has an IT team to handle server and maintenance. App development is outsourced to Everwell.

**ENABLING ENVIRONMENT**

- **Mobile penetration (Jan 2021)**: 79% ([6]
- **Smartphone (2020)**: 54% ([6]
- **Internet penetration (Jan 2021)**: 45% ([6]

**CURRENT RESOURCES AVAILABLE**

- The Global Fund has granted USD 280 million for the period of 2020-2022 to advance tuberculosis prevention and control in India.
- Nikshay platform is supported by domestic resources and by Bill & Melinda Gates Foundation (BMGF)
- A number of supportive digital applications linked to NIKHSAY including Digital Adherence technologies, CLM tools etc. are being supported by agencies like USAID, Stop TB partnership, Global Fund, Wadhwani AI etc.
MILESTONES ACHIEVED AND ROAD MAP

2012
Launch of NIKSHAY first version (Digital TB register)

2012-18
Application enhancement, Addition of inventory management module (NIKSHAY Aushadhi), NIKSHAY mobile app launch

2018
NIKSHAY 2.0 launch, Introduction of Direct Benefit Transfer module

2019
Development and introduction of NIKSHAY Dashboard, further enhancement of application ecosystem, LIPMS lab management system launch and integration

2021
Launch of patient and citizen centric app (TB Arogya Sathi), Addition of NIKSHAY drug dispensing module

2022
Integration of PVPI (Pharmacovigilance module) and development of contact tracing module in NIKSHAY

2023
Use of AI and data analytics and predictive modelling tools, Scale up of CXR AI modules

OTHER COMPLEMENTING DIGITAL TOOLS

KEY CHALLENGES

- Transitioning into paperless reporting of certain features in the programme remains a challenge. Though Nikshay is capable of this transition, issues with integration and operation delay this transition. Paper is still used for referrals, specimen transportation and reporting and treatment adherence monitoring.

- Scaling up of real-time data directly from different devices such as GeneXperts and TrueNAT and DST laboratories to Nikshay.

- LIMS is functional only in reference laboratories.

- Collecting real-time data on diagnostic tests (especially complete address of patients) from the TB laboratories in the private sector though notification from these laboratories has been improving.

- Tracking adverse drug reactions (ADR). However, the module for ADR monitoring is being developed.

- NIKSHAY produces large data base which need to be further analyzed using advanced analytical and data science approaches and predictive modeling.

- Linking other external data sources such as National Integrated Disease surveillance systems (IDSP), Integrated Health Information Platform (IHIP), HMIS, Vital Registration system, SIMS HIV data system etc.

NTP VISION

India has not only envisioned a comprehensive digital TB surveillance system but has also demonstrated that such systems can be implemented at scale at the lowest level of health facilities despite of huge infrastructure and other socio-economic barriers. As per the National Strategic Plan 2017-2025 put forth, India plans to leverage its existing NIKSHAY platform as a foundation to develop and integrate various other innovation that can be taken up to scale. Some of them are indicated below:

Further enriching the NIKSHAY analytics platform with more granular patient level and aggregated data for decision making and planning.

Further integrating other innovative solutions like Presumptive screening and contact tracing module, AI based CXR integration and community led platforms such as Aarogya Sathi app. and taking it to scale.

RESOURCE NEED

Based on multi-stakeholder discussions, country feedbacks and recommendations for fulfilling country’s vision, we have put together an estimated investment requirement and areas needing support for provisioning of a comprehensive case based digital TB surveillance system.

- **Software Development**: Based on various multi-stakeholder meetings and given the fact already have a strong foundation of a case-based reporting nationally, around **USD 800,000-1200,000** should be budgeted for comprehensive TB surveillance system development and analytical dashboard for data use. Supportive applications and software like ms-sql, asp.net, php, android kit, GIS applications etc can be included in the cloud based comprehensive service.

- **Hardware and Infrastructure**: Server/cloud. Based on the current volumes of new cases, would need an investment of **USD 500,000-600,000** for next 3 years for server and server maintenance. Alternatively, cloud based comprehensive service may be hired with pay-as-you-use arrangement, which can reduce the task of seamless management of hardware and environment.

- **Capacity Building and Implementation**: After the software development, a dedicated system admin and a developer should ideally be budgeted. The existing IT resources should be continued. A rough ongoing recurring cost of **USD 200,000-300,000** should be budgeted for 3 years for technical support.

TOTAL investment of around **USD 2 Million for 3 years** will be needed on developing a comprehensive case-based digital TB surveillance system for

Disclaimer: The above budget is a function of number of facilities, districts and regions and expected volume of data. This only provides a ballpark figure of what is needed in terms of budget.
RECOMMENDATIONS

Following are some of the key recommendations suggested based on the findings of this assessment of country’s digital ecosystem and infrastructure:

- **Data Use**: Advanced data science, big data analytics and AI based predictive modelling should be leveraged for forecasting demand for testing and treatment and help planning resource utilisation better.

  The data use should also use GIS based hotspot mapping and AI based hotspot predictions to enable epidemiological monitoring

  It should also focus on vulnerability and risk profiling of the patients so that highest risk patients such as patients with high-risk behaviour, nutrition needs, co-morbidity factors or migration factors can be prioritised for closer monitoring and differentiated care.

  Granular outputs of these initiatives must be linked and used for individual patient care with action-oriented reminders, alerts and feeds to patient, family and providers as well as related stakeholders.

  **Tentative timeline: Month 0-12**

- **Scaling up AI for TB elimination**: CTD is also piloting TRACE-TB (Transformative Research and Artificial Intelligence Capacity for Elimination of TB and Responding to Infectious Diseases) with support from USAID with the ambitious aim of eliminating TB from India by 2025. The work can be leveraged for

  - Using AI to read Line Probe Assay (LPA) to improve efficiency and minimize errors.
  - Identifying patient behavior patterns to identify those at risk of being Lost to Follow Up (LFU), case fatality, drug resistance and other unfavorable outcomes.
  - Cough sound based and voice-based AI tool for screening of tuberculosis which can be used by citizens using Arogya saathi mobile app

  **Tentative timeline: Month 6-12**

- **Development of more comprehensive e-Learning and Decision Support System (DSS)**: AI based decision support system tools can also be used for assisting both medical and non-medical professionals such as outreach workers for sputum collection, lab users or treatment initiators and others to provide a protocolised step by step assisted guide.

  Advances in Artificial Intelligence and Machine Learning algorithms should be explored to provide a more intelligent and intuitive assistance to health staffs for example automated daily tour routes to treatment supervisors for maximum impact based on existing data in their TB units. This
RECOMMENDATIONS

will not only help in improving services but also help in reducing the work burden and help staff focus on actual care.

Tentative timeline: Month 6-9

❖ System Integration: One of the challenges highlighted by NTP is leveraging the data collected from other tools into the main Nikshay system for effective use.

NIKSHAY has already established integration with external systems, like GeneXpert, TruNat, DBT, 99DOTS, etc. and have plans to integrate AI readings from Chest X-Rays. Additionally, the LIMS integration already in place should be expanded across the country so that all labs are connected to NIKSHAY database facilitating real-time lab data exchanges helping in real-time TB notification at diagnostic stage. Additionally, this integration should enable NTP to establish a molecular epidemiological surveillance system by gathering information on bacillary lineages and strains from the whole-genome sequencing laboratories and the multitude of mutations being captured at various central molecular diagnostic laboratories.

Nikshay should also be integrated with COVID-19 application of ICMR so that bidirectional screening and testing can be implemented more effectively. If other initiatives like NCD-TB screening application is integrated with Nikshay, it can be helpful increasing the case finding efforts as granular individual information on eligible presumptive TB can be sought across the country by NTEP out of community-based screening of population. Similarly, it is a long due for Nikshay to be integrated with e-PDS so that the TB patients and families can be linked with additional ration and food supplies. We recommend that these integrated systems are scaled up through standard with integration and security protocols such as FHIR/HL7 in addition to in-country Meta-Data and Data Standards (MDDS) and EHR / EMR standards of Health Ministry.

Though NIKSHAY already follows a strong national data security and privacy guidelines of National Informatics Center and hence other security guidelines should be explored based on need assessment and detailed evaluation. In addition, GDPR standards for more secured and seamless data collection and storage should be also explored.

Tentative timeline: Month 6-18

❖ Expansion and integration of the N-TB Nutrition App: We recommend to integrate the N-TB nutrition app as one of the integrated modules within NIKSHAY which can enable healthcare workers to assess nutritional status of patients with TB, estimating the weight gain required to reach an acceptable or optimal body mass index, and provides counselling tips on diet and an approximate daily calorie intake required for nutritional recovery.

Localized and customized diet charts based on the nutritional assessment may be included with pictorial suggestions to patients. The App is currently a stand-alone app but having it integrate with NIKSHAY will help treatment providers to capture nutritional status along with other risk and co-morbidity factors at the treatment initiation stage itself thus helping in recommending patients with appropriate nutritional support and further monitoring.

Tentative timeline: Month 6-12

❖ Scale up of Patient Centric Systems and CLM platforms: NIKSHAY has taken a huge leap in creating patient centric systems such as Aarogya Sathi and TB Mitra App in past. Community led monitoring and community participation is crucial to achieving the TB elimination target of 2025.

Either an extension of Aarogya Sathi App or integrating it with another TB CLM platform is strongly recommended which will provide a one-stop-shop for TB patients and people at high risk to get services they need.
**RECOMMENDATIONS**

The Patient centric platform can also integrate with platforms like such as medicine reminders, adverse drug side effect reporting etc.

*Tentative timeline: Month 1-12*

❖ **Pharmacovigilance integration with NIKSHAY:**

It is also recommended to integrate the National Pharmacovigilance system with the NIKSHAY platform to monitor and report adverse drug side effects specially for both new and generic TB drugs.

The Pharmacovigilance module should not only facilitate in reporting cases at facility and district level but should also be integrated with the patient centric platform recommended previously so that drug side effects can be self reported by the communities themselves.

*Tentative timeline: Month 3-8*

❖ **Data quality audit**

While Nikshay is well set and implemented across the country, it is important to ensure data quality on an ongoing basis and regular data quality audits should be undertaken preferably using third party assessment mechanisms by agencies like WHO.

*Tentative timeline: Month 6-24*

**ACKNOWLEDGMENT**

We thank the Joint Director (TB), Dr Nishant Kumar and the entire NTP team and partners for participating and engaging in the assessment. We would also like to extend our gratitude to Dr Vaibhav Shah for providing valuable insights into India's journey with Nikshay and vision for creating an integrated health information system.
